MODEL G0869/G0870
PORTABLE TABLE SAWS
OWNER'S MANUAL
(For models manufactured since 06/20)
This manual provides critical safety instructions on the proper setup, operation, maintenance, and service of this machine/tool. Save this document, refer to it often, and use it to instruct other operators.

Failure to read, understand and follow the instructions in this manual may result in fire or serious personal injury—including amputation, electrocution, or death.

The owner of this machine/tool is solely responsible for its safe use. This responsibility includes but is not limited to proper installation in a safe environment, personnel training and usage authorization, proper inspection and maintenance, manual availability and comprehension, application of safety devices, cutting/sanding/grinding tool integrity, and the usage of personal protective equipment.

The manufacturer will not be held liable for injury or property damage from negligence, improper training, machine modifications or misuse.

Some dust created by power sanding, sawing, grinding, drilling, and other construction activities contains chemicals known to the State of California to cause cancer, birth defects or other reproductive harm. Some examples of these chemicals are:

- Lead from lead-based paints.
- Crystalline silica from bricks, cement and other masonry products.
- Arsenic and chromium from chemically-treated lumber.

Your risk from these exposures varies, depending on how often you do this type of work. To reduce your exposure to these chemicals: Work in a well ventilated area, and work with approved safety equipment, such as those dust masks that are specially designed to filter out microscopic particles.

Contact Info

We stand behind our machines! If you have questions or need help, contact us with the information below. Before contacting, make sure you get the **serial number** and **manufacture date** from the machine ID label. This will help us help you faster.

Grizzly Technical Support  
1815 W. Battlefield  
Springfield, MO  65807  
Phone: (570) 546-9663  
Email: techsupport@grizzly.com

We want your feedback on this manual. What did you like about it? Where could it be improved? Please take a few minutes to give us feedback.

Grizzly Documentation Manager  
P.O. Box 2069  
Bellingham, WA  98227-2069  
Email: manuals@grizzly.com

Manual Accuracy

We are proud to provide a high-quality owner’s manual with your new machine!

We made every effort to be exact with the instructions, specifications, drawings, and photographs in this manual. Sometimes we make mistakes, but our policy of continuous improvement also means that **sometimes the machine you receive is slightly different than shown in the manual.**

If you find this to be the case, and the difference between the manual and machine leaves you confused or unsure about something, check our website for an updated version. We post current manuals and manual updates for free on our website at [www.grizzly.com](http://www.grizzly.com).

Alternatively, you can call our Technical Support for help. Before calling, make sure you write down the **Manufacture Date** and **Serial Number** from the machine ID label (see below). This information is required for us to provide proper tech support, and it helps us determine if updated documentation is available for your machine.

Identification

Become familiar with the names and locations of the controls and features shown below to better understand the instructions in this manual.

- CAUTION -

For Your Own Safety Read Instruction Manual Before Operating Saw
a) Wear eye protection.
b) Use saw-blade guard and spreader for every operation for which it can be used, including all through sawing.
c) Keep hands out of the line of saw blade.
d) Use a push-stick when required.
e) Pay particular attention to instructions on reducing risk of kickback.
f) Do not perform any operation freehand.
g) Never reach around or over saw blade.
Refer to the following figures and descriptions to become familiar with the basic controls and components of this machine. Understanding these items and how they work will help you understand the rest of the manual and minimize your risk of injury when operating this machine.

**Power Controls & Components**

A. **LED Power Indicator**: Illuminates when motor is turned **ON**.

B. **Variable-Speed Dial**: Rotates to adjust arbor speed from 2000–4000 RPM. Rotate clockwise to increase RPM; rotate counterclockwise to decrease RPM.

C. **ON Button**: Starts motor.

D. **OFF Button**: Stops motor.

E. **Blade Guard w/Anti-Kickback Protection**: Reduces risk of laceration and kickback-related injuries during cutting operations. Clear guard helps to prevent hands and fingers from contacting rotating blade. Anti-kickback pawls and spreader reduce risk of kickback (for information on kickback and how to prevent it, refer to Page 14).

F. **Blade Height Handwheel**: Rotates to adjust blade height from 0"–3 1/8". Rotate clockwise to raise blade; rotate counterclockwise to lower blade.

G. **Blade Tilt Scale & Pointer**: Indicate angle of blade tilt from 0°–45° left.

H. **Blade Tilt Lock Lever**: Secures blade tilt setting. Move right to unlock and allow blade tilt adjustment; move left to secure setting.

Note: **Blade tilt is adjusted manually by moving blade height handwheel left or right when lock lever is in unlocked position (see Page 34 for more information).**

**Blade Adjustment & Safety**

**Figure 2. Location of blade guard and blade adjustment controls.**

**Figure 1. Location of power controls and components.**
Table and Fence Controls & Components

I. Fence Scale & Pointer: Indicate distance of fence from blade. Set to desired width of finished workpiece.

J. Fence with Narrow-Rip Attachment: Supports long edge of workpiece during rip cuts. Narrow-rip attachment pivots down to allow narrow rip cuts with blade guard installed (refer to Page 32 for more information).

K. Table Extension: Slides out to provide support for long workpieces.

L. Fence Adjustment Knob: Rotates to adjust distance between fence and blade.

M. Fence Lock Lever: Locks fence position. Move down to loosen fence; move up to lock fence.

Figure 3. Location of table and fence controls and components.

Figure 4. Location of fence lock lever.
Glossary Of Terms

The following is a list of common definitions, terms and phrases used throughout this manual as they relate to this table saw and woodworking in general. Become familiar with these terms for assembling, adjusting or operating this machine. Your safety is VERY important to us at Grizzly!

**Arbor:** A metal shaft extending from the drive mechanism that is the mounting location for the saw blade.

**Bevel Edge Cut:** A cut made with the blade tilted to an angle between 0˚ and 45˚ to cut a beveled edge onto a workpiece. Refer to Page 34 for more details.

**Blade Guard Assembly:** Metal or plastic safety device that mounts over the saw blade. Its function is to prevent the operator from coming into contact with the saw blade. Refer to Page 28 for more details.

**Crosscut:** Cutting operation in which the cross-cut fence is used to cut across the shortest width of the workpiece. Refer to Page 33 for more details.

**Dado Blade:** Blade or set of blades that are used to cut grooves and rabbets. Refer to Page 34 for more details. The saw and arbor are not intended to safely use a larger dado blade.

**Dado Cut:** Cutting operation that uses a dado blade to cut a flat bottomed groove into the face of the workpiece. Refer to Page 34 for more details.

**Featherboard:** Safety device used to keep the workpiece against the rip fence and against the table surface. Refer to Page 39 for more details.

**Kerf:** The resulting cut or gap in the workpiece after the saw blade passes through during a cutting operation.

**Kickback:** An event in which the workpiece is propelled back towards the operator at a high rate of speed.

**Non-Through Cut:** A cut in which the blade does not cut through the top of the workpiece. Refer to Page 24 for more details.

**Parallel:** Being an equal distance apart at every point along two given lines or planes (i.e. the rip fence face is parallel to the face of the saw blade).

**Perpendicular:** Lines or planes that intersect and form right angles (i.e. the blade is perpendicular to the table surface).

**Push Stick:** Safety device used to push the workpiece through a cutting operation. Used most often when rip cutting thin workpieces. Refer to Page 42 for more details.

**Rabbet:** Cutting operation that creates an L-shaped channel along the edge of the workpiece. Refer to Page 36 for more details.

**Rip Cut:** Cutting operation in which the rip fence is used to cut across the widest width of the workpiece. Refer to Page 32 for more details.

**Riving Knife:** Metal plate located behind the blade. It maintains the kerf opening in the wood when performing a cutting operation. Refer to Page 31 for more details.

**Straightedge:** A tool used to check the flatness, parallelism, or consistency of a surface(s).

**Thin Kerf Blade:** Do not use a blade with a kerf or thickness that is thinner than a standard blade on this saw.

**Through Cut:** A cut in which the blade cuts completely through the workpiece. Refer to Page 25 for more details.
MODEL G0869 10" 2 HP BENCHTOP TABLE SAW WITH RIVING KNIFE

Product Dimensions:
- Weight: 65 lbs.
- Width (side-to-side) x Depth (front-to-back) x Height: 28 x 37-1/2 x 20-1/2 in.
- Footprint (Length x Width): 20-1/2 x 27 in.

Shipping Dimensions:
- Type: Cardboard Box
- Content: Machine
- Weight: 72 lbs.
- Length x Width x Height: 31 x 30 x 17 in.
- Must Ship Upright: Yes

Electrical:
- Power Requirement: 120V, Single-Phase, 60 Hz
- Full-Load Current Rating: 15A
- Minimum Circuit Size: 20A
- Connection Type: Cord & Plug
- Power Cord Included: Yes
- Power Cord Length: 6 ft.
- Power Cord Gauge: 14 AWG
- Plug Included: Yes
- Included Plug Gauge: 1-15
- Switch Type: ON/OFF Push-Button

Motors:
Main
- Horsepower: 2 HP
- Phase: Single-Phase
- Amps: 15A
- Speed: 20,000 RPM
- Type: Universal
- Power Transfer: Gearbox
- Bearings: Sealed & Permanently Lubricated

Main Specifications:
Main Information
- Table Saw Type: Benchtop
- Maximum Blade Diameter: 10 in.
- Arbor Size: 5/8 in.
- Arbor Speed: 2,000 - 4,000 RPM
- Maximum Width of Dado: 13/16 in.
- Blade Tilt Direction: Left
- Max Blade Tilt: 45 deg.
- Maximum Depth of Cut At 90 Degrees: 3-1/8 in.
- Maximum Depth of Cut At 45 Degrees: 2-1/4 in.
- Max Rip Right of Blade w/Included Fence & Rails: 28 in.
Additional Blade Information
- Included Blade Information: 10” x 40T
- Riving Knife/Spreader Thickness: 0.091 in.
- Required Blade Body Thickness: 0.079 in.
- Required Blade Kerf Thickness: 0.118 in.
- Rim Speed at Max Blade Diameter: 10,500 FPM

Table Information
- Floor to Table Height: 13-3/4 in.
- Table Size with Extension Wings Width: 26-3/8 in.
- Table Size with Extension Wings Depth: 32-1/4 in.
- Distance Front of Table to Center of Blade: 12-1/4 in.
- Distance Front of Table to Blade At Maximum Cut: 7-1/2 in.
- Main Table Size Thickness: 1-1/2 in.

Fence Information
- Fence Type: Aluminum
- Fence Size Width: 1 in.
- Fence Size Height: 2-3/8 in.
- Fence Rail Type: Aluminum
- Fence Rail Length: 26-3/8 in.
- Fence Rail Width: 1-1/2 in.
- Fence Rail Height: 1-1/4 in.

Miter Gauge Information
- Miter Gauge Slot Size Height: 3/8 in.
- Miter Gauge Slot Size Width: 3/4 in.
- Miter Gauge Slot Type: T-Slot

Construction
- Table: Aluminum
- Cabinet: Steel Tube w/Cover
- Trunnions: Aluminum
- Rails: Aluminum
- Miter Gauge Construction: Sheet Metal Body, Aluminum Bar
- Guard: Steel and Clear Plastic
- Arbor Bearings: Sealed & Permanently Lubricated

Other Related Information
- Number of Dust Ports: 1
- Dust Port Size: 2-1/2 in.
- Compatible Mobile Base: G0871

Other Specifications:
- Country of Origin: Taiwan
- Warranty: 1 Year
- Approximate Assembly & Setup Time: 15 Minutes
- Serial Number Location: Machine ID Label
- Sound Rating: 92 dB
- ISO 9001 Factory: Yes
- Certified by a Nationally Recognized Testing Laboratory (NRTL): Yes

Features:
- Built-In 4" Table Extension
- Only 7 Handwheel Turns for Min. to Max. Blade Elevation
- Quick-Release Blade Guard & Riving Knife
- Die-Cast Aluminum Table Insert
MODEL G0870 10" 2 HP 115V PORTABLE TABLE SAW WITH ROLLER STAND

Product Dimensions:
- Weight: 96 lbs.
- Width (side-to-side) x Depth (front-to-back) x Height: 41-1/2 x 37-1/2 x 41 in.
- Footprint (Length x Width): 31 x 30 x 24 in.

Shipping Dimensions:
- Type: Cardboard Box
- Content: Machine
- Weight: 106 lbs.
- Length x Width x Height: 31 x 30 x 24 in.
- Must Ship Upright: Yes

Electrical:
- Power Requirement: 120V, Single-Phase, 60 Hz
- Full-Load Current Rating: 15A
- Minimum Circuit Size: 20A
- Connection Type: Cord & Plug
- Power Cord Included: Yes
- Power Cord Length: 6 ft.
- Power Cord Gauge: 14 AWG
- Plug Included: Yes
- Included Plug Type: ON/OFF Push-Button

Motors:

Main
- Horsepower: 2 HP
- Phase: Single-Phase
- Amps: 15A
- Speed: 20,000 RPM
- Type: Universal
- Power Transfer: Gearbox
- Bearings: Sealed & Permanently Lubricated

Main Specifications:

Main Information
- Table Saw Type: Portable
- Maximum Blade Diameter: 10 in.
- Arbor Size: 5/8 in.
- Arbor Speed: 2,000 to 4,000 RPM
- Maximum Width of Dado: 13/16 in.
- Blade Tilt Direction: Left
- Max Blade Tilt: 45 Deg.
- Maximum Depth of Cut At 90 Degrees: 3-1/8 in.
- Maximum Depth of Cut At 45 Degrees: 2-1/4 in.
- Max Rip Right of Blade w/Included Fence & Rails: 28 in. w/4" Table Ext.
### Additional Blade Information
- Included Blade Information: 10" x 40T
- Riving Knife/Spreader Thickness: 0.091 in.
- Required Blade Body Thickness: 0.079 in.
- Required Blade Kerf Thickness: 0.118 in.
- Rim Speed at Max Blade Diameter: 10,500 FPM

### Table Information
- Floor to Table Height: 34 in.
- Table Size with Extension Wings Width: 26-3/8 in.
- Table Size with Extension Wings Depth: 32-1/4 in.
- Distance Front of Table to Center of Blade: 12-1/4 in.
- Distance Front of Table to Blade At Maximum Cut: 7-1/2 in.
- Main Table Size Thickness: 1-1/2 in.

### Fence Information
- Fence Type: Aluminum
- Fence Size Width: 1 in.
- Fence Size Height: 2-3/8 in.
- Fence Rail Type: Aluminum
- Fence Rail Length: 26-3/8 in.
- Fence Rail Width: 1-1/2 in.
- Fence Rail Height: 1-1/4 in.

### Miter Gauge Information
- Miter Gauge Slot Type: T-Slot
- Miter Gauge Slot Size Width: 3/4 in.
- Miter Gauge Slot Size Height: 3/8 in.

### Construction
- Table: Aluminum
- Cabinet: Steel Tube w/Cover
- Trunnions: Aluminum
- Rails: Aluminum
- Miter Gauge Construction: Sheet Metal Body, Aluminum Bar, Guard: Steel and Clear Plastic
- Arbor Bearings: Sealed & Permanently Lubricated

### Other Related Information
- Number of Dust Ports: 1
- Dust Port Size: 2-1/2 in.

### Other Specifications
- Country of Origin: Taiwan
- Warranty: 1 Year
- Approximate Assembly & Setup Time: 15 Minutes
- Serial Number Location: Machine ID Label
- Sound Rating: 92 dB
- ISO 9001 Factory: Yes
- Certified by a Nationally Recognized Testing Laboratory (NRTL): Yes

### Features:
- Built-In Stand Offers Easy Portability and Quick Setup at Job Sites
- Only 7 Handwheel Turns for Min. to Max. Blade Elevation
- Built-In 4" Table Extension
- Quick-Release Blade Guard and Riving Knife
- Die-Cast Aluminum Table Insert
- Flip-Down Fence for Small/Thin Workpieces
For Your Own Safety, Read Instruction Manual Before Operating This Machine

The purpose of safety symbols is to attract your attention to possible hazardous conditions. This manual uses a series of symbols and signal words intended to convey the level of importance of the safety messages. The progression of symbols is described below. Remember that safety messages by themselves do not eliminate danger and are not a substitute for proper accident prevention measures. Always use common sense and good judgment.

**DANGER** Indicates an imminently hazardous situation which, if not avoided, WILL result in death or serious injury.

**WARNING** Indicates a potentially hazardous situation which, if not avoided, COULD result in death or serious injury.

**CAUTION** Indicates a potentially hazardous situation which, if not avoided, MAY result in minor or moderate injury. It may also be used to alert against unsafe practices.

**NOTICE** Alerts the user to useful information about proper operation of the machine to avoid machine damage.

Safety Instructions for Machinery

**WARNING**

**OWNER’S MANUAL.** Read and understand this owner's manual BEFORE using machine.

**TRAINED OPERATORS ONLY.** Untrained operators have a higher risk of being hurt or killed. Only allow trained/supervised people to use this machine. When machine is not being used, disconnect power, remove switch keys, or lock-out machine to prevent unauthorized use—especially around children. Make your workshop kid proof!

**DANGEROUS ENVIRONMENTS.** Do not use machinery in areas that are wet, cluttered, or have poor lighting. Operating machinery in these areas greatly increases the risk of accidents and injury.

**MENTAL ALERTNESS REQUIRED.** Full mental alertness is required for safe operation of machinery. Never operate under the influence of drugs or alcohol, when tired, or when distracted.

**ELECTRICAL EQUIPMENT INJURY RISKS.** You can be shocked, burned, or killed by touching live electrical components or improperly grounded machinery. To reduce this risk, only allow qualified service personnel to do electrical installation or repair work, and always disconnect power before accessing or exposing electrical equipment.

**DISCONNECT POWER FIRST.** Always disconnect machine from power supply BEFORE making adjustments, changing tooling, or servicing machine. This prevents an injury risk from unintended startup or contact with live electrical components.

**EYE PROTECTION.** Always wear ANSI-approved safety glasses or a face shield when operating or observing machinery to reduce the risk of eye injury or blindness from flying particles. Everyday eyeglasses are NOT approved safety glasses.
WEARING PROPER APPAREL. Do not wear clothing, apparel or jewelry that can become entangled in moving parts. Always tie back or cover long hair. Wear non-slip footwear to reduce risk of slipping and losing control or accidentally contacting cutting tool or moving parts.

HAZARDOUS DUST. Dust created by machinery operations may cause cancer, birth defects, or long-term respiratory damage. Be aware of dust hazards associated with each workpiece material. Always wear a NIOSH-approved respirator to reduce your risk.

HEARING PROTECTION. Always wear hearing protection when operating or observing loud machinery. Extended exposure to this noise without hearing protection can cause permanent hearing loss.

REMOVE ADJUSTING TOOLS. Tools left on machinery can become dangerous projectiles upon startup. Never leave chuck keys, wrenches, or any other tools on machine. Always verify removal before starting!

USE CORRECT TOOL FOR THE JOB. Only use this tool for its intended purpose—do not force it or an attachment to do a job for which it was not designed. Never make unapproved modifications—modifying tool or using it differently than intended may result in malfunction or mechanical failure that can lead to personal injury or death!

AWKWARD POSITIONS. Keep proper footing and balance at all times when operating machine. Do not overreach! Avoid awkward hand positions that make workpiece control difficult or increase the risk of accidental injury.

CHILDREN & BYSTANDERS. Keep children and bystanders at a safe distance from the work area. Stop using machine if they become a distraction.

GUARDS & COVERS. Guards and covers reduce accidental contact with moving parts or flying debris. Make sure they are properly installed, undamaged, and working correctly BEFORE operating machine.

FORCING MACHINERY. Do not force machine. It will do the job safer and better at the rate for which it was designed.

NEVER STAND ON MACHINE. Serious injury may occur if machine is tipped or if the cutting tool is unintentionally contacted.

STABLE MACHINE. Unexpected movement during operation greatly increases risk of injury or loss of control. Before starting, verify machine is stable and mobile base (if used) is locked.

USE RECOMMENDED ACCESSORIES. Consult this owner’s manual or the manufacturer for recommended accessories. Using improper accessories will increase the risk of serious injury.

UNATTENDED OPERATION. To reduce the risk of accidental injury, turn machine OFF and ensure all moving parts completely stop before walking away. Never leave machine running while unattended.

MAINTAIN WITH CARE. Follow all maintenance instructions and lubrication schedules to keep machine in good working condition. A machine that is improperly maintained could malfunction, leading to serious personal injury or death.

DAMAGED PARTS. Regularly inspect machine for damaged, loose, or mis-adjusted parts—or any condition that could affect safe operation. Immediately repair/replace BEFORE operating machine. For your own safety, DO NOT operate machine with damaged parts!

MAINTAIN POWER CORDS. When disconnecting cord-connected machines from power, grab and pull the plug—NOT the cord. Pulling the cord may damage the wires inside. Do not handle cord/plug with wet hands. Avoid cord damage by keeping it away from heated surfaces, high traffic areas, harsh chemicals, and wet/damp locations.

EXPERIENCING DIFFICULTIES. If at any time you experience difficulties performing the intended operation, stop using the machine! Contact our Technical Support at (570) 546-9663.
Additional Safety for Table Saws

**WARNING**

Serious cuts, amputation, or death can occur from contact with rotating saw blade during operation. Workpieces, broken blades, or flying particles thrown by blade can blind or strike operators or bystanders with deadly force. To reduce the risk of these hazards, operator and bystanders MUST completely heed the hazards and warnings below.

**HAND & BODY POSITIONING.** Keep hands away from saw blade and out of blade path during operation, so they cannot accidentally slip into blade. Only operate at front of machine and always stand to side of blade path. Never reach behind or over blade, or under blade guard when blade is spinning.

**BLADE GUARD.** The blade guard protects operator from rotating saw blade. Make sure blade guard is installed, adjusted correctly, and used for all possible “through cuts.” Promptly repair or replace if damaged. Re-install immediately after operations that require its removal.

**RIVING KNIFE.** Use riving knife for all “non-through cuts.” Make sure it is aligned and positioned correctly. Promptly repair or replace it if damaged.

**KICKBACK.** Kickback occurs when saw blade ejects workpiece back toward operator. Know how to reduce risk of kickback, and learn how to protect yourself if it does occur.

**FEEDING WORKPIECE.** Feeding workpiece incorrectly increases risk of kickback. Always allow blade to reach full speed before cutting, feed workpiece from front of saw, making sure workpiece is flat against table and a fence, miter gauge, or other guide is used to feed workpiece in a straight line. Feed cuts through to completion. Never start saw with workpiece touching blade or pull workpiece from behind blade. Never back workpiece out of cut, move it sideways, or perform a “freehand” operation. Never plunge cut.

**PUSH STICKS/PUSH BLOCKS.** To reduce risk of accidental blade contact, use push sticks/push blocks whenever possible. In event of an accident, these will often take damage that would have occurred to hands/fingers.

**FENCE.** To reduce risk of kickback, make sure fence remains properly adjusted and parallel with blade. Always lock fence before using. Do not use fence while using miter gauge.

**CUT-OFF PIECES.** To avoid risk of injury due to blade contact, turn saw OFF and allow blade to completely stop before removing cut-off pieces near blade or trapped between blade and table insert. Never use your hands to move cut-off pieces away from blade while saw is running.

**BLADE ADJUSTMENTS.** Adjusting blade height or tilt during operation increases risk of crashing blade and sending metal fragments flying with deadly force at operator or bystanders. Only adjust blade height and tilt when blade is completely stopped and saw is OFF.

**CHANGING BLADES.** Accidental startup while changing saw blade can result in serious injury. To reduce risk of accidental blade contact, always disconnect power before changing blades.

**DAMAGED SAW BLADES.** Damaged saw blade teeth can become deadly projectiles. Never use blades that have been dropped or damaged.

**DADO AND RABBET OPERATIONS.** Dado and rabbeting operations require special attention since they must be performed with blade guard removed, which increases risk of blade contact. DO NOT attempt dado or rabbeting operations without first reading these sections in this manual.

**CUTTING CORRECT MATERIAL.** Cutting metal, glass, stone, tile, etc., increases risk of operator injury due to kickback or flying particles. Only cut natural and man-made wood products, laminate-covered wood products, and some plastics. Never cut materials not intended for this saw.
Preventing Kickback

Below are ways to avoid the most common causes of kickback:

- Only cut workpieces with at least one smooth and straight edge. DO NOT cut warped, cupped or twisted wood.

- Keep the blade guard installed and working correctly for all through cuts.

- Never attempt freehand cuts. If the workpiece is not fed parallel with the blade, kickback will likely occur. Always use the rip fence or miter gauge to support the workpiece.

- Make sure the spreader or riving knife is aligned with the blade. A misaligned spreader or riving knife can cause the workpiece to catch or bind, increasing the chance of kickback.

- Take the time to check and adjust the rip fence parallel with the blade; otherwise, the chances of kickback are extreme.

- The spreader or riving knife maintains the kerf in the workpiece, reducing the chance of kickback. Always use the spreader with the blade guard for all through cuts.

- Feed cuts through to completion. Anytime you stop feeding a workpiece in the middle of a cut, the chance of kickback is greatly increased.

- Keep the blade guard installed and in good working order. Only remove it when performing non-through cuts and immediately re-install the blade guard when finished. Remember, always use the riving knife for all non-through operations, unless a dado blade is installed.

- Make multiple, shallow passes when performing a non-through cut. Making a deep non-through cut will greatly increase the chance of kickback.

- Never move the workpiece backwards or try to back it out of a cut while the blade is moving. If you cannot complete a cut for some reason, stop the saw motor and allow the blade to completely stop before backing the workpiece out. Promptly fix the condition that prevented you from completing the cut.

Protecting Yourself From Kickback

Even if you know how to prevent kickback, it may still happen. Here are some ways to protect yourself if kickback DOES occur:

- Stand to the side of the blade during every cut. If kickback does occur, the thrown workpiece usually travels directly in front of the blade.

- Wear safety glasses or a face shield. In the event of kickback, your eyes and face are the most vulnerable part of your body.

- Never, for any reason, place your hand behind the blade. Should kickback occur, your hand will be pulled into the blade, which could cause amputation.

- Use a push stick to keep your hands farther away from the moving blade. If kickback occurs, the push stick will most likely take the damage your hand would have received.

- Use featherboards or anti-kickback devices to assist with feeding and prevent or slow down kickback.

⚠️ CAUTION

Statistics show that most common accidents among table saw users can be linked to kickback. Kickback is typically defined as the high-speed expulsion of stock from the table saw toward its operator. In addition to the danger of the operator or others in the area being struck by the flying stock, it is often the case that the operator’s hands are pulled into the blade during kickback.
SECTION 2: POWER SUPPLY

Availability
Before operating the machine, consider the availability and proximity of the required power supply circuit. If an existing circuit does not meet the requirements for this machine, a new circuit must be installed. To minimize the risk of electrocution, fire, or equipment damage, installation work and electrical wiring must be done by an electrician or qualified service personnel in accordance with all applicable codes and standards.

Full-Load Current Rating
The full-load current rating is the amperage a machine draws at 100% of the rated output power. On machines with multiple motors, this is the amperage drawn by the largest motor or sum of all motors and electrical devices that might operate at one time during normal operations.

120V Circuit Requirements
This machine is prewired to operate on a power supply circuit that has a verified ground and meets the following requirements:

- Voltage: 120V
- Cycle: 60 Hz
- Phase: Single-Phase
- Power Supply Circuit: 20 Amps

A power supply circuit includes all electrical equipment between the breaker box or fuse panel in the building and the machine. The power supply circuit used for this machine must be sized to safely handle the full-load current drawn from the machine for an extended period of time. (If this machine is connected to a circuit protected by fuses, use a time delay fuse marked D.)

WARNING
Serious injury could occur if you connect machine to power before completing setup process. DO NOT connect to power until instructed later in this manual.

WARNING
Electrocution, fire, shock, or equipment damage may occur if machine is not properly grounded and connected to power supply.

CAUTION
For your own safety and protection of property, consult an electrician if you are unsure about wiring practices or electrical codes in your area.

Note: Circuit requirements in this manual apply to a dedicated circuit—where only one machine will be running on the circuit at a time. If machine will be connected to a shared circuit where multiple machines may be running at the same time, consult an electrician or qualified service personnel to ensure circuit is properly sized for safe operation.
**Polarized Plug**

This tool is double-insulated and therefore does not have a grounding wire or plug. The two-pronged, NEMA 1-15 plug has a polarized end; this means that one prong (the neutral connector) is wider than the other (the hot connector). Polarized plugs must be used only with polarized receptacles. Do not attempt to plug this machine into a non-polarized receptacle. If a polarized receptacle is not available, a qualified electrical technician will have to install one before the machine can be plugged in.

**Figure 5.** Typical 1-15 plug and receptacle.

---

**Extension Cords**

When using extension cords, make sure the cords are rated for outdoor use. Outdoor use cords are marked with a "W-A" or a "W" to signify their rating. Always check to make sure that the extension cords are in good working order and free of any type of damage, such as exposed wires, cuts, creased bends, or missing prongs.

Extension cords cause voltage drop, which may damage electrical components and shorten motor life. Voltage drop increases as the extension cord size gets longer and the gauge size gets smaller (higher gauge numbers indicate smaller sizes). When using extension cords, always choose the shortest cord possible, with the greatest-sized gauge.

Below is a list of minimum gauge sizes needed for running this tool at different lengths:

- **50 Feet** ..................................................... 12AWG
SECTION 3: SETUP

- WARNING -
This machine presents serious injury hazards to untrained users. Read through this entire manual to become familiar with the controls and operations before starting the machine!

- WARNING -
Wear safety glasses during the entire setup process!

- CAUTION -
This machine and its components are heavy. Get lifting help to move heavy items.

### Needed for Setup

The following items are needed, but not included, for the setup/assembly of this machine.

**Description** | **Qty**
--- | ---
- An Assistant | 1
- Wrench or Socket 13mm | 1
- Dust Collection System | 1
- Dust Hose 2½" | 1
- Hose Clamps 2½" | 2
- Hex Wrench 3mm | 1
- Straightedge | 1

### Unpacking

This machine was carefully packaged for safe transport. When unpacking, separate all enclosed items from packaging materials and inspect them for shipping damage. **If items are damaged, please call us immediately at (570) 546-9663.**

**IMPORTANT:** Save all packaging materials until you are completely satisfied with the machine and have resolved any issues between Grizzly or the shipping agent. **You MUST have the original packaging to file a freight claim. It is also extremely helpful if you need to return your machine later.**
Inventory

The following is a list of items shipped with your machine. Before beginning setup, lay these items out and inventory them.

If any non-proprietary parts are missing (e.g. a nut or a washer), we will gladly replace them; or for the sake of expediency, replacements can be obtained at your local hardware store.

**NOTICE**

If you cannot find an item on this list, carefully check around/inside the machine and packaging materials. Often, these items get lost in packaging materials while unpacking or they are pre-installed at the factory.

Site Considerations

Workbench Load
Refer to the Machine Data Sheet for the weight and footprint specifications of your machine. Some workbenches may require additional reinforcement to support the weight of the machine and workpiece materials.

Placement Location
Consider anticipated workpiece sizes and additional space needed for auxiliary stands, work tables, or other machinery when establishing a location for this machine in the shop. Below is the minimum amount of space needed for the machine.

![Figure 10. Minimum working clearances.](image)

**CAUTION**
Children and visitors may be seriously injured if unsupervised around this machine. Lock entrances to the shop or disable start switch or power connection to prevent unsupervised use.

Assembly

Assembly of Model G0869/G0870 consists of installing the fence, table extension, and blade guard/spreader with anti-kickback pawls. Additionally, the roller stand that comes with Model G0870 must be assembled and the saw mounted to it.

Installing Fence & Table Extension
1. Place fence on rails with fence mounting holes positioned over (3) pre-installed mounting screws, then tighten fence lock knob to secure (see Figure 11).

![Figure 11. Fence installed.](image)

2. Attach table extension rest to (2) table extension shafts using (2) 6mm flat washers and (2) M6-1 x 10 Phillips head screws (see Figure 12).

3. Insert table extension shafts into mounting holes on rear of machine (see Figure 12).

4. Thread (2) table extension lock knobs into locations shown in Figure 12.

![Figure 12. Table extension partially installed.](image)
5. Tip saw on its side, then install (2) cotter pins, one in each table extension shaft, as shown in Figure 13.

![Figure 13. Installing cotter pin on one of two table extension shafts inside saw cabinet.](image)

### CAUTION

The blade guard/spreader reduces the risk of laceration and amputation injuries and MUST always be installed on the saw for all normal through cuts. For more information on the blade guard/spreader and how to use it, refer to Page 28.

### Installing Blade Guard/Spreader with Anti-Kickback Pawls

1. DISCONNECT MACHINE FROM POWER!

2. Remove table insert, then raise blade all the way up.

3. Move lock lever up to release spreader/riving knife clamp (see Figure 14).

![Figure 14. Location of spreader/riving knife clamp and lock lever.](image)

4. Insert blade guard/spreader into spreader/riving knife clamp (see Figure 15). Ensure holes in spreader align with bumps inside clamp.

![Figure 15. Spreader mounting location.](image)

5. Move lock lever down to secure blade guard/spreader, then tug blade guard/spreader up to make sure it is locked in place.

6. Loosen blade guard knob (see Figure 16), slide upper blade guard assembly toward front of saw, and remove it from spreader.

![Figure 16. Location of blade guard knob for installing anti-kickback pawls.](image)
7. Insert front of pawl assembly into spreader where shown in Figure 17, then pivot back of pawl assembly down and snap in place.

Figure 17. Installing anti-kickback pawls onto spreader.

8. Re-install upper blade guard assembly and tighten blade guard knob (see Figure 16).

Assembling Roller Stand (G0870)

1. Attach (2) wheels to axle with (2) 8mm flat washers and (2) M8-1.25 lock nuts (see Figure 18).

2. Attach left handle to stand body with (2) M8-1.25 x 16 button head cap screws (see Figure 18).

3. Attach right handle to stand body with (4) M8-1.25 x 40 button head cap screws and (4) M8-1.25 lock nuts (see Figure 18).

Mounting Table Saw to Roller Stand (G0870 Only)

1. Push leg lock buttons in and unfold legs until lock buttons click into place in holes shown in Figure 19.

Figure 19. Location of stand legs, leg lock buttons, and leg lock holes.

2. Place table saw unit on stand and secure with (4) M8-1.25 x 40 carriage bolts, (4) 8mm flat washers, and (4) M8-1.25 lock nuts (see Figure 20).

Note: The table saw can mount to the stand facing either direction—with the stand wheels oriented to the left or to the right.

Figure 20. Model G0869 mounted on Model G0871 Roller Stand.
Dust Collection

⚠️ CAUTION
This machine creates a lot of wood chips/dust during operation. Breathing airborne dust on a regular basis can result in permanent respiratory illness. Reduce your risk by wearing a respirator and capturing the dust with a dust-collection system.

Minimum CFM at Dust Port: 150 CFM
Do not confuse this CFM recommendation with the rating of the dust collector. To determine the CFM at the dust port, you must consider these variables: 1) CFM rating of the dust collector, (2) hose type and length between the dust collector and the machine, (3) number of branches or wyes, and (4) amount of other open lines throughout the system. Explaining how to calculate these variables is beyond the scope of this manual. Consult an expert or purchase a good dust collection "how-to" book.

Test Run

Once assembly is complete, test run the machine to ensure it is properly connected to power and safety components are functioning correctly.

If you find an unusual problem during the test run, immediately stop the machine, disconnect it from power, and fix the problem BEFORE operating the machine again. The Troubleshooting table in the SERVICE section of this manual can help.

The Test Run consists of verifying that the motor powers up and runs correctly.

⚠️ WARNING
Serious injury or death can result from using this machine BEFORE understanding its controls and related safety information. DO NOT operate, or allow others to operate, machine until the information is understood.

⚠️ WARNING
DO NOT start machine until all preceding setup instructions have been performed. Operating an improperly set up machine may result in malfunction or unexpected results that can lead to serious injury, death, or machine/property damage.

To test run machine:

1. Clear all setup tools away from machine.
2. Connect machine to power supply.
3. Turn machine ON, verify motor operation, and then turn machine OFF.

The motor should run smoothly and without unusual problems or noises. If machine does not run smoothly, or you notice unusual problems or noises, immediately disconnect machine from power and call Tech Support for help.

To connect dust collection system to machine:

1. Fit the 2½” dust hose over the dust port, as shown in Figure 21, and secure in place with a hose clamp.

2. Tug the hose to make sure it does not come off. Note: A tight fit is necessary for proper performance.

Figure 21. Dust hose attached to dust port.
SECTION 4: OPERATIONS

Operation Overview

The purpose of this overview is to provide the novice machine operator with a basic understanding of how the machine is used during operation, so the machine controls/components discussed later in this manual are easier to understand.

Due to the generic nature of this overview, it is not intended to be an instructional guide. To learn more about specific operations, read this entire manual, seek additional training from experienced machine operators, and do additional research outside of this manual by reading "how-to" books, trade magazines, or websites.

To complete a typical operation, the operator does the following:

1. Examines workpiece to make sure it is suitable for cutting.

2. Adjusts blade tilt, if necessary, to correct angle for desired cut.

3. Adjusts blade height no more than 1/4" higher than thickness of workpiece.

4. Adjusts fence to desired width of cut, then locks it in place.

5. Checks outfeed side of machine for proper support and to make sure workpiece can safely pass all the way through blade without interference.

6. Puts on safety glasses, respirator, and hearing protection, and locates push sticks/blocks if needed.

7. Starts saw.

8. Feeds workpiece all the way through blade while maintaining firm pressure on workpiece against table and fence, and keeping hands and fingers out of blade path and away from blade.

9. Stops machine immediately after cut is complete.

Eye injuries, respiratory problems, or hearing loss can occur while operating this tool. Wear personal protective equipment to reduce your risk from these hazards.

If you are not experienced with this type of machine, WE STRONGLY RECOMMEND that you seek additional training outside of this manual. Read books/magazines or get formal training before beginning any projects. Regardless of the content in this section, Grizzly Industrial will not be held liable for accidents caused by lack of training.
Workpiece Inspection

Some workpieces are not safe to cut on this machine or may need to be modified before they can be safely cut. **Before cutting, inspect all workpieces for the following:**

- **Material Type:** This machine is intended for cutting natural and man-made wood products, laminate-covered wood products, and some plastics. Cutting drywall or cementitious backer board creates extremely fine dust and may reduce the life of the motor bearings. This machine is NOT designed to cut metal, glass, stone, tile, etc.; cutting these materials with a table saw greatly increases the risk of injury and damage to the saw or blade.

- **Foreign Objects:** Nails, staples, dirt, rocks and other foreign objects are often embedded in wood. While cutting, these objects can become dislodged and hit the operator, cause kickback, or break the blade, which might then fly apart. Always visually inspect your workpiece for these items. If they can’t be removed, DO NOT cut the workpiece.

- **Large/Loose Knots:** Loose knots can become dislodged during the cutting operation. Large knots can cause kickback and machine damage. Choose workpieces that do not have large/loose knots or plan ahead to avoid cutting through them.

- **Wet or “Green” Stock:** Cutting wood with a moisture content over 20% causes unnecessary wear on the blades, increases the risk of kickback, and yields poor results.

- **Excessive Warping:** Workpieces with excessive cupping, bowing, or twisting are dangerous to cut because they are unstable and may move unpredictably when being cut.

- **Minor Warping:** Slightly cupped workpieces can be safely supported with cupped side facing the table or fence; however, workpieces supported on the bowed side will rock during the cut, which could cause kickback.

Non-Through & Through Cuts

**Non-Through Cuts**

A non-through cut is a sawing operation where the blade does not protrude above the top face of the wood stock, as shown in the **Figure** below.

Examples of non-through cuts include dadoes and rabbets. Non-through cuts have a higher risk of injury from kickback because the blade guard must be removed. However, the riving knife **MUST** be installed because it still provides some protection.

**IMPORTANT:** When making non-through cuts with a dado blade, do not attempt to cut the full depth in one pass. Instead, take multiple light passes to reduce the load on the blade.

A dado blade smaller than 10" will require removal of the riving knife, because the riving knife will be higher than the blade.
Through Cuts
A through cut is a sawing operation in which the workpiece is completely sawn through, as shown in the Figure below. Examples of through cuts are rip cuts, cross cuts, miter cuts, and beveled cuts. The blade guard assembly MUST be used when performing through cuts.

Blade Requirements
When choosing a main blade, make sure the blade size meets the requirements listed below. The thickness of the blade body and teeth can be measured with calipers or any precision measuring device.

Blade Size Requirements:
- Body Thickness: 0.063"–0.094" (1.8-2.4mm)
- Kerf (Tooth) Thickness: 0.102"–0.126" (2.6-3.2mm)
- Riving Knife Thickness: 0.1" (2.5mm)
- Blade Size Required for Riving Knife: 10"

Blade Selection
This section on blade selection is by no means comprehensive. Always follow the saw blade manufacturer's recommendations to ensure safe and efficient operation of your table saw.

Ripping Blade Features:
- Best for cutting with the grain
- 20-40 teeth
- Flat-top ground tooth profile
- Large gullets for large chip removal

Crosscut blade features:
- Best for cutting across the grain
- 60-80 teeth
- Alternate top bevel tooth profile
- Small hook angle and a shallow gullet
Combination blade features:
- Designed to cut both with and across grain
- 40-50 teeth
- Alternate top bevel and flat, or alternate top bevel and raker tooth profile
- Teeth are arranged in groups
- Gullets are small and shallow (similar to a cross-cut blade), then large and deep (similar to a ripping blade)

Figure 26. Combination blade.

Laminate blade features:
- Best for cutting plywood or veneer
- 40-80 teeth
- Triple chip tooth profile
- Very shallow gullet

Figure 27. Laminate blade.

Thin Kerf Blade: A blade with thinner kerf than a standard blade. Since the spreader/riving knife included with this table saw is sized for standard blades, thin kerf blades cannot be used on this saw unless they meet the Blade Requirements specified in this manual; otherwise, they will increase the risk of kickback.

Dado Blades

Stacked Dado Blade (see below): Multiple blades are stacked together to control the cutting width. Stacked dado blades are more expensive than wobble blades, but typically produce higher quality results.

Wobble Dado Blade: A single blade mounted at a slight angle on an arbor hub. The blade angle is adjustable on the hub, and the width of the dado cut is controlled by the angle setting of the blade.

Figure 28. Stacked dado blade.
Blade Installation

Review this section, even if your saw blade came pre-installed.

To remove & install blade:

1. DISCONNECT MACHINE FROM POWER!

2. Raise arbor all the way up, then remove table insert and blade guard/spreader (see Page 28) or riving knife (see Page 31).

3. Push arbor lock in (see Figure 29) and rotate existing blade until it locks in place (or rotate arbor if no blade is installed).

4. While pressing arbor lock, use included arbor wrench to loosen and remove arbor nut, flange, and blade (see Figure 30). Arbor nut has right-hand threads; rotate counterclockwise to loosen.

   !

   To reduce risk of injury, always disconnect power to saw before changing blades. Since blade is sharp, use extra care and wear gloves when installing it.

5. Install new blade, flange and arbor nut on arbor, as shown in Figure 31, with teeth facing front of the saw.

   Arbor Lock

   Figure 29. Location of arbor lock.

   Figure 30. Example of removing table saw blade.

   Figure 31. Correct order of installation with teeth facing the correct direction.

6. Re-install blade guard/spreader (see Page 28) or riving knife (see Page 31), and table insert.
Blade Guard Assembly

The term "blade guard" refers to the assembly that consists of the clear polycarbonate shield, the spreader, and the anti-kickback pawls on each side of the spreader (see Figure 32). Each of these components has important safety functions during operation of the saw.

Guard

The clear polycarbonate guard allows the operator to watch the blade cut the workpiece during operation. This guard is designed to lift as the workpiece is pushed into the blade and remain in contact with the workpiece throughout the entire cut.

The guard reduces injury risk by providing a barrier around the blade that prevents accidental contact and contains flying wood chips.

To ensure that the guard does its job effectively, the guard must always be in the downward position against the table during idle operation, and the hinge mechanism must be maintained in good working condition so the guard can freely pivot up and down to accommodate the height of the workpiece and return to the table surface.

Spreader

The spreader is a metal plate that prevents the newly cut kerf of the workpiece from pinching the backside of the blade, causing kickback.

The spreader also acts as a barrier behind the blade to shield hands from being pulled into the blade if a kickback occurs.

⚠️ CAUTION

In order to work properly, the spreader cannot be bent or misaligned with the blade. If the spreader gets accidentally bent, take the time to straighten it or just replace it. Using a bent or misaligned spreader will increase the risk of kickback! Refer to Page 53 to check or adjust spreader alignment if necessary.
Anti-Kickback Pawls
The anti-kickback pawls allow the workpiece to travel in only one direction. If the workpiece moves backwards, such as during a kickback, the pawls will dig into the workpiece to slow or stop it.

To work properly, the pawls must return to their resting position after pivoting, shown in Figure 33.

If the pawls fail to return to the resting position, the pivot area may need to be cleaned or the spring may have been dislodged or broken and will need to be fixed/replaced.

Removing Pawls
You might remove the pawls if you are concerned about them scratching a delicate workpiece, or if you believe that they will obstruct a narrow workpiece and cause feeding difficulty or loss of control. Use your best judgment before removing the pawls, as they are provided for your safety.

![Figure 33. Pawls in resting position.](image)

**CAUTION**
We do not recommend removing pawls for normal operations unless absolutely necessary. In most situations, disabling pawls will increase your risk of serious personal injury in event of a kickback.

**CAUTION**
The pawls are sharp and can lacerate fingers or hands. Use caution, and wear leather gloves when handling the pawls to reduce risk of injury.

To remove pawls:

1. **DISCONNECT MACHINE FROM POWER!**

2. Loosen blade guard knob (see Figure 34), slide upper blade guard assembly toward front of saw, and remove it from spreader.

![Figure 34. Location of blade guard knob.](image)
3. Push pawl release button, tilt back of pawl assembly up, then lift pawl assembly off of spreader (see Figure 35).

4. Re-install upper blade guard assembly and tighten blade guard knob (see Figure 34 on Page 29).

**When to Use the Blade Guard**
The blade guard assembly MUST always be installed on the saw for all normal through cuts (those where the blade cuts all the way through the thickness of the workpiece). If the blade guard is removed for specific operations, always immediately replace it after those operations are complete.

**When Not to Use the Blade Guard**
The blade guard cannot be used on any non-through cuts (those in which the blade does not cut all the way through the thickness of the workpiece).

**IMPORTANT:** Whenever the blade guard cannot be used, the riving knife must be installed.

Sometimes the blade guard or its components can get in the way when cutting very narrow workpieces or other specialized cuts. Because the blade guard is provided to decrease your risk of injury, it should not be used if it gets in the way of making a safe cut. Use good judgment!

---

**Pawl Release Button**

**Installing Pawls**
To install the pawls, insert front of pawl assembly into spreader where shown in Figure 36, then pivot back of pawl assembly down and snap in place. Re-install upper blade guard assembly and tighten blade guard knob (see Figure 34 on Page 29).

---

**Figure 35.** Removing anti-kickback pawls.

**Figure 36.** Installing anti-kickback pawls.
Riving Knife

The riving knife works in the same manner as the spreader on the blade guard assembly. It is a metal plate that prevents the newly cut workpiece from pinching the backside of the blade and causing kickback.

The key difference between the spreader and the riving knife is that the riving knife mounts below the blade’s highest point of rotation, as shown in Figure 37.

![Figure 37. Height difference between riving knife and blade.](image)

The height difference between the riving knife and the blade allows the workpiece to pass over the blade during non-through cuts (those in which the blade does not cut all the way through the thickness of the workpiece).

The riving knife acts as a barrier behind the blade to reduce the risk of hands being pulled into the blade if a kickback occurs.

The riving knife must be kept within the range shown in Figure 38. For that reason, we only recommend using a 10" blade for operations that require use of the riving knife.

![Figure 38. Allowable top and bottom distances between riving knife and blade.](image)

How to Install the Riving Knife

The riving knife is installed into the spreader/riving knife clamp in the same way as the blade guard/spreader (see Figure 39). Refer to Page 20 for blade guard assembly/installation instructions.

![Figure 39. Riving knife installed.](image)

When to Use the Riving Knife

Use the riving knife for all non-through cuts made with a standard table saw blade (i.e., dadoes or rabbet cuts, and when using a tenoning jig), or when using a 10" diameter dado blade.

Also, use the riving knife for operations where the blade guard or its components get in the way of safe operation, such as with very narrow cuts.

When Not to Use the Riving Knife

Do not use the riving knife with a dado blade that has a diameter smaller than 10". Otherwise, the riving knife height will exceed the blade height and the workpiece will hit the riving knife during the cut, forcing the operator into a dangerous situation of trying to turn the saw off with the workpiece stuck halfway through the cut.

In addition, although it is possible to use the riving knife for through-cutting operations, the blade guard offers far more injury protection and risk reduction than the riving knife. Therefore, we strongly recommend that you use the blade guard instead of the riving knife for through cuts.
Ripping

"Ripping" means cutting with the grain of a natural wood workpiece. In man-made materials such as MDF or plywood, ripping means cutting lengthwise.

**CAUTION**

Serious injury can be caused by kickback. Kickback is a high-speed ejection of stock from table saw toward an operator. The operator or bystanders may be struck by flying stock, or operator's hands can be pulled into blade during kickback.

To make a rip cut:

1. Review Preventing Kickback on Page 14 and take necessary precautions to reduce likelihood of kickback.

2. If using natural wood, joint one long edge of workpiece on a jointer.

3. DISCONNECT MACHINE FROM POWER!

4. Ensure that blade guard/spreader is installed.

5. For typical rip cuts, place narrow rip fence attachment in up position; for rip cuts less than 1" wide, place the narrow rip fence in the down position (see Figure 40).

6. Set fence to desired width of cut on scale.

7. Adjust blade height so highest saw tooth protrudes no more than ¼" above workpiece.

8. Set up safety devices such as featherboards or other anti-kickback devices, making sure no safety devices are contacting blade.

9. Plug saw into power source, turn it ON, and allow it to reach full speed.

**Note:** Jointed edge of workpiece must slide against fence during cutting operation.

10. Use push stick to feed workpiece through saw blade, as shown in Figure 41, until workpiece is completely beyond saw blade.

---

**WARNING**

Keep blade guard installed and in down position. Failure to do this could result in serious personal injury or death.

**WARNING**

Turn saw OFF and allow blade to come to a complete stop before removing cutoff piece. Failure to follow this warning could result in severe lacerations or amputation.
**Crosscutting**

"Crosscutting" means cutting across the grain of a natural wood workpiece, usually with a miter saw. In other man-made materials, such as MDF or plywood, crosscutting means cutting across the width of the workpiece.

**To make a crosscut using a miter gauge:**

1. DISCONNECT MACHINE FROM POWER!
2. Ensure that blade guard/spreader is installed.
3. To avoid kickback, move rip fence aside and position miter gauge, adjusted to 90°, in a miter slot.
4. Adjust blade height so teeth protrude no more than 1⁄4" above workpiece.
5. Slide miter gauge near blade and adjust workpiece so blade will cut on waste side of line.
6. Plug in table saw, turn it ON, and allow it to reach full speed.
7. Hold workpiece firmly against face of miter gauge (as shown in Figure 42), and ease it through blade until workpiece is completely past saw blade.

**Miter Cuts**

A miter is an angled crosscut. Miters are usually cut in the same manner as crosscuts, using the miter gauge and a predetermined mark on the workpiece.

**To perform a miter cut:**

1. DISCONNECT MACHINE FROM POWER!
2. Ensure that blade guard/spreader is installed.
3. Determine angle of cut. If angle needs to be very precise, use a protractor to set miter gauge to blade.
4. Place face of miter gauge against edge of workpiece and place bar across face of workpiece. Use bar as a guide to mark your cut, as shown in Figure 43.
5. Place miter gauge back into slot and hold workpiece firmly against miter gauge body. Slide miter gauge near blade and adjust workpiece so blade will cut on waste side of line.
6. Proceed to make cut in same manner as described in Crosscutting instructions.

![Figure 42. Typical crosscutting operation.](image1)

![Figure 43. Example of marking miter line.](image2)

**WARNING**

Turn saw OFF and allow blade to come to a complete stop before removing cutoff piece. Failure to follow this warning could result in severe lacerations or amputation.
Blade Tilt/Bevel Cuts

When the blade tilt collar bolts are properly adjusted (as described starting on Page 50), the blade tilt handwheel allows the operator to tilt the blade to the left, between 0° and 45°. This is used most often when cutting bevels, compound miters, or chamfers. Figure 44 shows an example of the blade when tilted to 45°.

![Figure 44. Example of blade tilted to 45° for bevel cutting (blade guard removed for clarity).](image)

Dado Cutting

Commonly used in furniture joinery, a dado is a straight channel cut in the face of the workpiece. Dadoes are “non-through” cuts that can be made with a dado blade or a standard saw blade. The Figure below shows a cutaway view of a dado cut being made with a dado blade.

![Figure 45. Example of a dado being cut with a dado blade.](image)

The Model G0869/G0870 can accommodate dado blades up to 10" in diameter (see Accessories on Page 44). However, you MUST install the included riving knife while using a 10" diameter dado blade, as it provides a barrier behind the blade and reduces the risk of hands being pulled into the blade if kickback occurs.

DO NOT use the riving knife if you install a dado blade smaller than 10" in diameter. Otherwise, the riving knife height will exceed the blade height and the workpiece will hit the riving knife during the cut, forcing the operator into a dangerous situation and trying to turn the saw off with the workpiece stuck halfway through the cut.

Note: You MUST use a dado insert for this operation. This item does not come with model G0869/G0870, however, it can be purchased as an aftermarket accessory (see Page 44).

Installing a Dado Blade

1. DISCONNECT MACHINE FROM POWER!

2. Remove table insert, blade guard assembly or riving knife, arbor nut, flange, and saw blade.

3. Attach and adjust dado blade system according to dado blade manufacturer’s instructions, and secure with arbor flange and arbor nut.

4. Install dado table insert.

WARNING

DO NOT make through cuts with a dado blade. The extra width of a dado blade will increase the risk of kickback during a through cut. Dado blades are only intended for non-through cuts. Failure to heed this warning could result in serious injury.

WARNING

Never try to cut a warped board by holding it down against the table. If kickback occurs, your hand could be pulled into the blade, resulting in accidental contact with the rotating blade, causing severe lacerations or amputation.
Cutting Dadoes with a Dado Blade
Because dado blades are much wider than standard blades, they place a greater amount of force against the workpiece when cutting. This additional force increases the risk of kickback, requiring the operator to take additional steps when cutting to keep their injury risk at an acceptable level.

WARNING
Dado blades have a higher risk of kickback than normal blades because their larger size applies stronger forces to the workpiece. This risk increases relative to the depth and width of the cut. To minimize your risk of serious personal injury, ensure that stock is flat and straight, and make multiple light cuts (rather than one deep cut) to achieve the desired cutting depth.

The Figure below demonstrates the sequential process of making multiple, light cuts that get progressively deeper. The actual number of cuts used should be determined by workpiece hardness, total dado depth, and feed rate. In general, if you hear the motor slow down during the cut, you are cutting too deep or feeding too fast.

To cut a dado with a dado blade:
1. DISCONNECT MACHINE FROM POWER!
2. Adjust dado blade to desired depth of cut.
3. Adjust distance between fence and inside edge of blade, as shown in Figure 45 on Page 34, to dado length of a workpiece.
   — If dadoing across workpiece, use miter gauge and carefully line up desired cut with dado blade. To reduce kickback, DO NOT use fence in combination with miter gauge.
4. Reconnect saw to power source.
5. Turn saw ON. Blade should run smoothly, with no vibrations.
6. When blade has reached full speed, perform test cut with scrap piece of wood.
7. If cut is satisfactory, repeat cut with actual workpiece.

Cutting Dadoes with a Standard Blade
A ripping blade (described on Page 25) is typically the best blade to use when cutting dadoes with a standard blade because it removes sawdust very efficiently.

To use a standard saw blade to cut dadoes:
1. DISCONNECT MACHINE FROM POWER!
2. Mark width of dado cut on workpiece. Include marks on edge of workpiece so cut path can be aligned when workpiece is lying on table.
3. Raise blade up to desired depth of cut (depth of dado channel desired).
4. Set saw up for type of cut you need to make, depending on whether it is a rip cut (Page 32) or crosscut (Page 33).
5. Align blade to cut one side of dado, as shown in Figure 47.

6. Reconnect saw to power source and turn saw ON. Allow blade to reach full speed, then perform cutting operation.

7. Repeat cutting operation on other side of dado, as shown in Figure 48.

8. Make additional cuts (see Figure 49) in center of dado to clear out necessary material. Dado is complete when channel is completely cleared out.

Rabbet Cutting

Commonly used in furniture joinery, a rabbet is an L-shaped groove cut in the edge of the workpiece. Rabbets can be cut with either a dado blade or a standard saw blade.

Rabbet cutting on the edge of the workpiece with a dado blade requires a sacrificial fence (see Figure 50). Make the sacrificial fence the same length as the fence and 3/4" thick. Attach it to the fence with screws or clamps, making sure they are all secure and tight. Raise the blade into the sacrificial fence to the height needed.

When using a dado blade, the included dado table insert must be installed and used during rabbeting operations.

⚠️ WARNING

Dado blades have a higher risk of kickback than normal blades because their larger size applies stronger forces to the workpiece. This risk increases relative to the depth and width of the cut. To minimize your risk of serious personal injury, ensure that stock is flat and straight, and make multiple light cuts (rather than one deep cut) to achieve the desired cutting depth.
Cutting Rabbets with a Dado Blade

1. DISCONNECT MACHINE FROM POWER!

2. Adjust dado blade to height needed for rabbeting operation. When cutting deep rabbets, take more than one pass to reduce risk of kickback.

3. Adjust fence and align workpiece to perform cutting operation, as shown in Figure 51.

4. Reconnect saw to power source and turn saw ON. When blade has reached full speed, perform a test cut with a scrap piece of wood.

   — If cut is satisfactory, repeat cut with workpiece.

Cutting Rabbets with a Standard Blade

A ripping blade is typically the best blade to use for cutting rabbets when using a standard blade because it removes sawdust very efficiently. (See Page 25 for blade details.) Also, a sacrificial fence is not required when cutting rabbets with a standard blade.

To cut rabbets with a standard blade:

1. DISCONNECT MACHINE FROM POWER!

2. Ensure that riving knife and standard table insert are installed.

3. Mark width of rabbet cut on edge of workpiece, so you can clearly identify intended cut while it is laying flat on saw table.

4. Raise blade up to desired depth of cut (depth of rabbet channel desired).

5. Stand workpiece on edge, as shown in Figure 52, then adjust fence so blade is aligned with inside of your rabbet channel.

   — If workpiece is very tall, or is unstable when placed against fence, lay it flat on table and use a dado blade to perform rabbet cut.
6. Reconnect saw to power source, then perform cut.

7. Lay workpiece flat on table, as shown in **Figure 53**, adjust saw blade height to intersect with first cut, then perform second cut to complete rabbet.

---

**Figure 53.** Example of second cut to create a rabbet.

---

**WARNING**

DO NOT place a tall board on edge to perform a rabbet cut with a standard blade. Workpieces that are too tall to properly support with fence can easily shift during operation and cause kickback. Instead, place stock flat on saw and perform rabbet cut with a dado blade, as instructed on Page 37.
Featherboards

Easily made from scrap stock, featherboards provide an added degree of protection against kickback, especially when used together with push sticks. They also maintain pressure on the workpiece to keep it against the fence or table while cutting, which makes the operation easier and safer because the cut can be completed without the operator's hands getting near the blade. The angled ends and flexibility of the fingers allow the workpiece to move in only one direction.

Making a Featherboard

This sub-section covers the two basic types of featherboards: 1) Those secured by clamps, or 2) those secured with the miter slot.

Material Needed for Featherboard

Hardwood ¾" x 3" x 10" (Minimum)
Hardwood ¾" x 6" x 28" (Maximum) ..........1

Additional Material Needed for Mounting Featherboard in Miter Slot

Hardwood ¾" x (Miter Slot Width) x 5"L ................................1
Wing Nut ¼"-20 .............................................................1
Flat Head Screw ¼"-20 x 2" .........................................1
Flat Washer ¼"-20 ..........................................................1

To make a featherboard:

1. Cut a hardwood board approximately ¾" thick to size. The length and width of the board can vary according to your design. Most featherboards are 10"-28" long and 3"-6" wide. Make sure the wood grain runs parallel with the length of the featherboard, so the fingers you will create in Step 3 will bend without breaking.

2. Cut a 30° angle at one end of the board.

3. Make a series of end cuts with the grain ⅜"-¼" apart and 2"-3" long, as shown in Figure 54 (A). Alternatively, start cuts at 2"-3" deep, then make them progressively deeper, as shown in Figure 54 (B).

IMPORTANT: Cuts made across the grain result in weak fingers that easily break when flexed. When made correctly, the fingers should withstand flexing from moderate pressure. To test the finger flexibility, push firmly on the ends with your thumb. If the fingers do not flex, they are likely too thick (the cuts are too far apart).

CAUTION

We recommend using a bandsaw for making fingers in the next step because it tends to be safer. A table saw can be used, but it will over-cut the underside of the ends, produce a thicker kerf, and require you to stop the blade half-way through the cut, which can be dangerous.

NOTICE

Only Steps 1–3 are required to make a clamp-mounted featherboard. Refer to Page 41 for instructions on clamping.
4. Rout a $\frac{1}{4}"-\frac{3}{8}"$ wide slot 4"–5" long in workpiece and 1"–2" from short end of featherboard (see Figure 55).

![Figure 55. Slot routed in featherboard.](image)

5. Cut a miter bar approximately 5" long that will fit in table miter slot, as shown in Figure 56.

![Figure 56. Miter bar pattern.](image)

Tip: Consider making miter bar longer for larger featherboards—approximately half the length of total featherboard—to support force applied to the featherboard during use.

6. Drill a $\frac{1}{4}"$ hole in center of bar, then countersink bottom to fit a $\frac{1}{4}"$-20 flat head screw.

7. Mark a 4" line through center of countersunk hole in center, then use a jig saw with a narrow blade to cut it out.

8. Assemble miter bar and featherboard with a $\frac{1}{4}"$-20 x 2" flat head screw, flat washer, and a wing nut or a star knob (see Figure 57). Congratulations! Your featherboard is complete.

![Figure 57. Assembling miter slot featherboard components.](image)

Note: The routed slot, countersink hole, and flat head screw are essential for miter bar to clamp into miter slot. When wing nut is tightened, it will draw flat head screw upward into countersunk hole. This will spread sides of miter bar and force them into walls of miter slot, locking featherboard in place.

Tip: The length of the flat head screw depends on thickness of featherboard—though 1½" to 2" lengths usually work.

Now, proceed to Mounting Featherboard in Miter Slot on Page 41.
Mounting Featherboards w/Clamps

1. Lower saw blade, then adjust fence to desired width and secure it.

2. Place workpiece against fence, making sure it is 1" in front of the blade.

3. Place a featherboard on table away from blade so all fingers point forward and contact workpiece (see Figure 58).

4. Secure featherboard to table with a clamp.

5. Check featherboard by pushing it with your thumb to ensure it is secure.
   — If featherboard moves, tighten clamp more.

6. Optional: If cutting long workpieces, it may be beneficial to use a second featherboard attached to fence to keep board firmly against table while feeding.

Mounting Featherboard in Miter Slot

1. Lower saw blade, then adjust fence to desired width and secure it.

2. Place workpiece evenly against fence, making sure it is 1" in front of blade.

3. Slide featherboard miter bar into miter slot, making sure fingers slant toward blade, as shown in Figure 59.

4. Position fingered edge of featherboard against edge of workpiece, so that all fingers contact workpiece. Slide featherboard toward blade until first finger is nearly even with end of workpiece, which should be 1" away from blade.

5. Double-check workpiece and featherboard to ensure they are properly positioned, as described in Step 4. Then secure featherboard to table. Check featherboard by hand to make sure it is tight.

   Note: The featherboard should be placed firmly enough against workpiece to keep it against fence but not so tight that it is difficult to feed workpiece.
Push Sticks

When used correctly, push sticks reduce the risk of injury by keeping hands away from the blade while cutting. In the event of an accident, a push stick can also absorb damage that would have otherwise happened to hands or fingers.

Using a Push Stick

Use push sticks whenever your hands will get within 12" of the blade. To maintain control when cutting large workpieces, start the cut by feeding with your hands then use push sticks to finish the cut, so your hands are not on the end of the workpiece as it passes through the blade.

Feeding: Place the notched end of the push stick against the end of the workpiece (see Figure 61 below), and move the workpiece into the blade with steady downward and forward pressure.

Supporting: A second push stick can be used to keep the workpiece firmly against the fence while cutting. When using a push stick in this manner, only apply pressure before the blade; otherwise, pushing the workpiece against or behind the blade will increase the risk of kickback (see "Push Stick Prohibition Zone" in Figure 60 below).

Figure 60. Using push sticks to rip narrow stock.

Figure 62. Template for a basic shop-made push stick (not shown at actual size).
Push Blocks

When used correctly, a push block reduces the risk of injury by keeping hands away from the blade while cutting. In the event of an accident, a push block often takes the damage that would have otherwise happened to hands or fingers.

Using a Push Block

A push block can be used in place of or in addition to a push stick for feeding workpieces into the blade. Due to their design, push blocks allow the operator to apply firm downward pressure on the workpiece that could not otherwise be achieved with a push stick.

The push block design on this page can be used in two different ways (see Figure 65). Typically, the bottom of the push block is used until the end of the workpiece reaches the blade.

Making a Push Block

Use this template to make your own push block.

Figure 63. Side view of a push block in use.

Figure 65. Template for a shop-made push block (shown at 50% of full size).

The notched end of the push block is then used to push the workpiece the rest of the way through the cut, keeping the operator's hands at a safe distance from the blade. A push stick is often used at the same time in the other hand to support the workpiece during the cut (see Using a Push Stick on Page 42).

Figure 64. Using a push block and push stick to make a rip cut.

SECTION 6: GRIZZLY
AFTERMARKET ACCESSORIES

⚠️ WARNING
Installing unapproved accessories may cause machine to malfunction, resulting in serious personal injury or machine damage. To reduce this risk, only install accessories recommended for this machine by Grizzly.

NOTICE
Refer to our website or latest catalog for additional recommended accessories.

For G0869:
G0871—Roller Stand
This stand is the perfect complement to the G0869 Portable Table Saw. It quickly and easily folds up, allowing access to the built-in rollers, and features an integrated handle for easy mobility around the jobsite. 24" x 37" footprint.

Figure 66. G0871 Roller Stand for G0869.

D3122—Push Stick
This essential safety item keeps hands a safe distance from the blade while maintaining control of the workpiece against the table and fence. An absolute necessity when running narrow stock. Durable handle is designed for maximum control. Measures 13½" overall.

Figure 67. D3122 Push Stick.

T30542—Dado Insert for G0869/G0870
Dado Insert engineered for G0869 and G0870 portable table saws. Pre-cut throat—ready to use. Features twist lock for tool-free operation and positioning set screws to ensure a solid and precise fit in the table.

Figure 68. T30542 Dado Insert for G0869/G0870.
Forrest Woodworker II Saw Blades
T20778—10", 20 Teeth
T20779—10", 40 Teeth
T23527—10", 48 Teeth
Hailed as the Cadillac of all blades, Forrest saw blades have become legendary for their ability to leave highly polished, finish-ready surfaces on nearly everything they cut. Made in USA. With this all-purpose blade for table saws you can rip and crosscut rockhards and softwoods, resulting in a smooth as sanded surface. With 20° face hook, ply veneers will crosscut with no bottom splinter at moderate feed rates. Double hard and 40% stronger C4 carbide will give up to 300% longer life between sharpenings. Ends blade changing (one blade does rip, combo and crosscut), second-step finishing and cutting 1/16" oversize to allow for resurfacing. Buy and sharpen one blade instead of 3 (24T rip, 50T combination and 80T crosscut). 5/8" arbor, 1/8" kerf.

Figure 69. Forrest Woodworker II Saw Blade.

Figure 70. W1400 Push Block.

W1400—Push Block
Made of high-impact molded plastic, these safety push blocks have a layer of friction rubber on the bottom that grabs your workpiece as you press down. We strongly recommend these for use with jointers, router tables, shapers and table saws. Measures 3" x 6".

Figure 71. G2795 10" x 24T Stack Dado Set.

G2795—10" x 24T Stack Dado Set
These are some of the finest precision dado heads available. Put them to work on wood, prefinished materials, Formica® and other related products. Fits standard 5/8" arbors and width can be varied from 1/8" to 13/16". Set includes (2) 24-tooth blades, (5) chippers, (12) shims: (4) .010" and (8) .020", and blade carrier.

Figure 72. D3096 Featherboard.

D3096—Featherboard
Reduce the risk of kickback without the use of clamps. These featherboards are designed to lock into 1/8" and 1/4" miter gauge slots and are adjustable for various stock widths.

order online at www.grizzly.com or call 1-800-523-4777
SECTION 7: MAINTENANCE

Cleaning & Protecting

Cleaning the Model G0869/G0870 is relatively easy. Vacuum excess wood chips and sawdust, and wipe off the remaining dust with a dry cloth. If any resin has built up, use a resin-dissolving cleaner to remove it.

Lubrication

It is essential to clean components before lubricating them because dust and chips build up on lubricated components and make them hard to move. Simply adding more grease to them will not yield smooth-moving components.

Clean the components in this section with an oil/grease solvent cleaner and shop rags.

If you thoroughly clean the components in this section before lubricating them, the result will be silky smooth movement when turning the handwheels, which will result in much higher enjoyment on your part!

The following are the main components that need to be lubricated:

- Trunnion Slides
- Blade Height Rack & Pinion
- Front and Rear Fence Rack & Pinion

Schedule

For optimum performance from this machine, this maintenance schedule must be strictly followed.

Ongoing
To maintain a low risk of injury and proper machine operation, if you ever observe any of the items below, shut down the machine immediately and fix the problem before continuing operations:

- Loose mounting bolts/arbor nut.
- Damaged saw blade.
- Worn or damaged wires.
- Any other unsafe condition.

Weekly Maintenance
- Clean table surface and miter slot grooves.
- Clean and protect cast-iron table.
- Clean rip fence.

Monthly Check
- Clean/vacuum dust buildup from inside cabinet and off motor.

Every 6–12 Months
- Lubricate trunnion slides (Page 47).
- Lubricate blade height and fence rack & pinion (Page 47).
Trunnion Slides
Lubrication Type ... T26419 or NLGI#2 Equivalent
Amount .......................................................... 1-2 Dabs
Lubrication Frequency ........................................6–12 Months

Clean out the front and rear trunnion slides with mineral spirits and a rag, then apply grease into each groove. Move the blade tilt back and forth to spread the grease (see Figures 73–75).

Blade Height and Fence Rack & Pinion Assemblies
Lubrication Type ... T26419 or NLGI#2 Equivalent
Amount .......................................................... Dab
Lubrication Frequency ........................................6–12 Months

Clean away any built-up grime and debris from the rack & pinion assemblies (see Figures 76–78) with a wire brush, rags, and mineral spirits. Allow the components to dry, then apply a thin coat of grease to them. Move components through range of motion to spread grease.
SECTION 8: SERVICE

Review the troubleshooting procedures in this section if a problem develops with your machine. If you need replacement parts or additional help with a procedure, call our Technical Support. **Note:** Please gather the serial number and manufacture date of your machine before calling.

Troubleshooting

Motor & Electrical

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Cause</th>
<th>Possible Solution</th>
</tr>
</thead>
</table>
| Machine does not start, or power supply breaker immediately trips after startup. | 1. Power supply circuit breaker tripped or fuse blown.  
2. Plug/receptacle at fault/wired incorrectly.  
3. ON/OFF switch at fault.  
4. Motor at fault. | 1. Ensure circuit is sized correctly and free of shorts. Reset circuit breaker or replace fuse.  
2. Test for good contacts; correct the wiring.  
3. Test/replace switch.  
4. Test/repair/replace. |
| Machine stalls or is underpowered. | 1. Feed rate/cutting speed too fast.  
2. Workpiece material unsuitable for machine.  
4. Blade dull or incorrect for type of cut.  
5. Motor brushes worn/at fault.  
2. Only cut wood/ensure moisture is below 20%.  
3. Clean motor/let cool, and reduce workload.  
4. Use correct, sharp blade; reduce feed rate.  
5. Inspect/replace motor brushes (Page 56).  
6. Test/replace. |
| Machine has vibration or noisy operation. | 1. Motor or component loose.  
2. Blade at fault.  
4. Arbor bearings at fault. | 1. Inspect/replace damaged bolts/nuts, and re-tighten with thread-locking fluid.  
2. Replace warped/bent blade; resharpen dull blade.  
3. Tighten mounting bolts; relocate/shim machine.  
4. Replace arbor housing bearings; replace arbor. |

</table>
Blade Tilt Stops

The table saw features stop cams that stop the blade exactly at 45° and 90° when tilting it. The stops have been set at the factory and should require no adjustments, unless you notice that your cuts are not accurate.

Note: The tilt scale reads "0" when the blade is 90° to the table.

</tr>
</tbody>
</table>

Setting 90° Stop Cam

1. DISCONNECT MACHINE FROM POWER!

2. Raise blade as high as it will go, then tilt it toward 0° until it stops and cannot be tilted any more.

3. Place 90° square against table and blade so it contacts blade evenly from bottom to top, as shown in Figure 79. Make sure blade tooth does not obstruct placement of square.

4. Tilt blade to approximately 25°, so there is room to adjust 90° stop cam (see Figure 81).

---

---

Figure 79. Checking blade at 90°.

---

---

Figure 81. Location of 90° stop cam.

---

---

Figure 80. Location of tilt scale pointer and adjustment screw.

— If blade is not 90° to table, you will need to adjust 90° stop cam. Proceed to Step 4.

---

---

Figure 80. Location of tilt scale pointer and adjustment screw.

— If blade is not 90° to table, you will need to adjust 90° stop cam. Proceed to Step 4.

---

---

Figure 80. Location of tilt scale pointer and adjustment screw.

— If blade is not 90° to table, you will need to adjust 90° stop cam. Proceed to Step 4.

---

---

Figure 80. Location of tilt scale pointer and adjustment screw.

— If blade is not 90° to table, you will need to adjust 90° stop cam. Proceed to Step 4.
5. Loosen stop cam adjustment screw (see Figure 82) just enough so cam can be rotated without it slipping out of position.

6. Insert tip of Phillips head screwdriver into a cam adjustment hole (see Figure 82) and move cam slightly up or down as necessary to adjust where blade tilt will stop.
   - Rotate cam adjustment hole up to move stop farther to left.
   - Rotate cam adjustment hole down to move stop farther to right.

7. Tighten stop cam adjustment screw to secure adjustment.

8. Tilt blade toward 90° until handwheel contacts stop cam, lock blade tilt setting, then recheck to see if blade is square to table (see Step 3 on Page 50).

9. If necessary, repeat Steps 4–8 until blade is perfectly square to table when handwheel is contacting 90° stop cam.

Setting 45° Stop Cam

1. DISCONNECT MACHINE FROM POWER!

2. Raise blade as high as it will go, then tilt it towards 45° until it stops and cannot be tilted any more.

3. Place a 45° square against table and blade so it contacts blade evenly from bottom to top, as shown in Figure 83. Make sure a blade tooth does not obstruct placement of square.

   — If blade is 45° to table, then no adjustment to stop cam is necessary. Make sure tilt scale pointer shown in Figure 80 on Page 50 points to 45° mark on scale. If necessary, adjust position by loosening adjustment screw, moving pointer with your fingers, then tightening screw.

   — If blade is not 45° to table, adjust 45° stop cam in similar manner as adjusting 90° stop cam (see Steps 4–9 of Setting 90° Stop Cam, starting on Page 50).
Miter Slot to Blade Parallelism

The table saw will provide best results if the miter slot is adjusted parallel to the blade. If it is not exactly parallel, your cuts and your finished work will be lower in quality, but more importantly, the risk of kickback will be increased. Take the time to adjust your table saw properly. A few minutes now will be time well spent.

Tools Needed

<table>
<thead>
<tr>
<th>Tool</th>
<th>Qty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjustable Square</td>
<td>1</td>
</tr>
<tr>
<td>Marker</td>
<td>1</td>
</tr>
<tr>
<td>Hex Wrench 5mm</td>
<td>1</td>
</tr>
</tbody>
</table>

To adjust the blade parallel to the miter slot:

1. DISCONNECT SAW FROM POWER!

2. Use an adjustable square to measure the distance from the miter slot to a carbide tip on the blade, as shown in Figure 84. Make sure that the face of the adjustable square is even along the miter slot.

3. With the end of the adjustable square just touching the tip, lock the square in place. Now, mark the carbide tip with a marker where you made this measurement.

4. Rotate the marked blade tip to the other end of the table insert.

5. Slide the adjustable square down to the other end of the table insert, and compare the distance from the marked blade tip to the end of the adjustable square.

   —If the blade tip measurement is the same on both sides, the miter slot is parallel with the table; the procedure is complete.

   —If the blade tip measurement is not the same on both sides, the table will need to be adjusted. Proceed to Step 6.

6. To adjust the table, slightly loosen the cap screws in the trunnion mounting locations (see Figure 85) and slightly tap the trunnions in the needed direction. Repeat Steps 2–5 until the blade and miter slot are parallel.

7. Tighten the trunnion mounting cap screws.

Figure 84. Example of adjusting blade to miter slot.

Figure 85. Trunnion mounting screws.
### Spreader or Riving Knife Alignment

#### Checking Alignment
The blade guard spreader and riving knife must be aligned with the blade when installed. If the spreader or riving knife is not aligned with the blade, then the workpiece will be forced sideways during the cut, which will increase the risk of kickback.

**Items Needed**
- Straightedge ...................................................... 1

**To check spreader/riving knife alignment:**

1. DISCONNECT MACHINE FROM POWER!

2. Raise saw blade to maximum height so you have easy working access.

3. Place straightedge against side of blade and spreader/riving knife at top and bottom, as shown in **Figure 86**. Spreader/riving knife should be parallel with blade along its length at both positions, and in *Alignment Zone,* as shown in **Figure 87**.

**Adjusting Alignment**
The spreader/riving knife mounting position can be adjusted into alignment with the blade using the set screws on the spreader/riving knife mounting block.

**Items Needed**
- Hex Wrench 3mm............................................... 1

**To adjust spreader/riving knife position:**

1. DISCONNECT MACHINE FROM POWER!

2. Remove table insert.
3. Loosen (2) cap screws on mounting block, then adjust either top or bottom control set screws or side control set screws (see Figure 88) to move it the needed direction.

4. Re-install table insert.

5. Follow Checking Alignment, Steps 1–3.
   - If spreader/riving knife is in alignment zone, no additional steps are necessary.
   - If spreader/riving knife is still not in alignment zone, continue adjusting set screws on mounting block as necessary to correctly position spreader/riving knife.

6. Tighten (2) cap screws on mounting block to secure spreader/riving knife adjustment.

Adjusting Bent Spreader/Riving Knife

1. DISCONNECT MACHINE FROM POWER!

2. Bend spreader or riving knife by hand while installed, then follow Steps 1–3 in Checking Alignment on Page 53 to determine if it is parallel with blade and inside "Alignment Zone" (refer to Figure 87 in Checking Alignment on Page 53).
   - If this doesn't work, remove it to straighten.
   - If you cannot straighten it properly, replace it.

**Figure 88.** Set screws for adjusting spreader/riving knife position.

**Top and Bottom Control:** To move the top of the spreader/riving knife right or left (and the bottom of the spreader/riving knife in the opposite direction), adjust the top and bottom pair of set screws on the mounting block an equal amount in the opposite direction.

**Side Control:** To move the front of the spreader/riving knife left or right (and the rear of the spreader/riving knife in the opposite direction), adjust each pair of side control set screws an equal amount in the opposite direction.
Fence Scale Calibration

The fence scale indicator window, shown in Figure 89, can be calibrated with the fence scale if you notice that your cuts do not accurately match what is shown on the fence scale.

The indicator adjusts by loosening the two mounting screws and sliding it in the desired direction.

**Items Needed**

<table>
<thead>
<tr>
<th>Qty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phillips Head Screwdriver #2</td>
</tr>
<tr>
<td>Scrap Piece of Wood</td>
</tr>
<tr>
<td>Tape Measure</td>
</tr>
</tbody>
</table>

**To calibrate fence scale indicator windows:**

1. Position and lock fence at 13", as indicated by scale, then cut your scrap piece of wood.
2. Reposition and lock fence at 12", as indicated by scale.
3. Flip your scrap piece of wood over, placing side that was cut in Step 2 against fence, and cut your scrap piece of wood.
4. Measure width of freshly cut workpiece with tape measure. Workpiece width should be exactly 12". If it is not, then adjust indicator window to match the width of workpiece.

---

Table/Dado Insert Adjustment

The table/dado insert must sit perfectly flush with the table to provide a smooth, continuous surface for the workpiece to slide over. The insert is held in place by a magnet and sits on top of four adjustment screws (see Figure 90).

The insert should be checked and adjusted any time it is removed and replaced, after prolonged use, or any time you notice the workpiece or fence does not slide smoothly over the insert.

**Tools Needed**

<table>
<thead>
<tr>
<th>Qty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hex Wrench 2.5mm</td>
</tr>
<tr>
<td>Straightedge</td>
</tr>
</tbody>
</table>

**To check and adjust insert:**

1. **DISCONNECT MACHINE FROM POWER!**

2. Place straightedge across insert and check to make sure insert is flush with table at front and back of throat.
   - If insert is flush with table, no adjustments are necessary.
   - If insert is not flush with table, proceed to Step 3.

3. Insert hex wrench through holes shown in Figure 90 and either loosen screws to raise insert, or tighten screws to lower it. Repeat Steps 2–3 until insert is perfectly flush with surface of table.
**Brush Replacement**

This table saw is equipped with a universal motor that uses two carbon brushes to transmit electrical current inside the motor. These brushes are considered to be regular "wear items" or "consumables" that will need to be replaced during the life of the motor. The frequency of required replacement is often related to how much the motor is used and how hard it is pushed.

Replace the carbon brushes (part number: P0869133-14 for G0869, or P0870133-14 for G0870) at the same time when the motor no longer reaches full power, or when the brushes measure less than 1⁄4" long (new brushes are 5⁄8" long).

**Tools Needed:**

<table>
<thead>
<tr>
<th>Qty</th>
<th>Standard Screwdriver #2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>.............................................1</td>
</tr>
</tbody>
</table>

To inspect and replace motor brushes:

1. **DISCONNECT MACHINE FROM POWER!**

2. Remove brush caps and worn brushes (see Figure 91) from motor.

3. Replace both motor brushes and install brush caps.

**Figure 91.** Location of motor brushes and brush caps.
SECTION 9: WIRING

These pages are current at the time of printing. However, in the spirit of improvement, we may make changes to the electrical systems of future machines. Compare the manufacture date of your machine to the one stated in this manual, and study this section carefully.

If there are differences between your machine and what is shown in this section, call Technical Support at (570) 546-9663 for assistance BEFORE making any changes to the wiring on your machine. An updated wiring diagram may be available. Note: Please gather the serial number and manufacture date of your machine before calling. This information can be found on the main machine label.

![WARNING]

**Wiring Safety Instructions**

**SHOCK HAZARD.** Working on wiring that is connected to a power source is extremely dangerous. Touching electrified parts will result in personal injury including but not limited to severe burns, electrocution, or death. Disconnect the power from the machine before servicing electrical components!

**MODIFICATIONS.** Modifying the wiring beyond what is shown in the diagram may lead to unpredictable results, including serious injury or fire. This includes the installation of unapproved aftermarket parts.

**WIRE CONNECTIONS.** All connections must be tight to prevent wires from loosening during machine operation. Double-check all wires disconnected or connected during any wiring task to ensure tight connections.

**CIRCUIT REQUIREMENTS.** You MUST follow the requirements at the beginning of this manual when connecting your machine to a power source.

**WIRE/COMPONENT DAMAGE.** Damaged wires or components increase the risk of serious personal injury, fire, or machine damage. If you notice that any wires or components are damaged while performing a wiring task, replace those wires or components.

**MOTOR WIRING.** The motor wiring shown in these diagrams is current at the time of printing but may not match your machine. If you find this to be the case, use the wiring diagram inside the motor junction box.

**CAPACITORS/INVERTERS.** Some capacitors and power inverters store an electrical charge for up to 10 minutes after being disconnected from the power source. To reduce the risk of being shocked, wait at least this long before working on capacitors.

**EXPERIENCING DIFFICULTIES.** If you are experiencing difficulties understanding the information included in this section, contact our Technical Support at (570) 546-9663.

---

Model G0869/G0870 (Mfd. Since 06/20) -57-
The machine wiring shown here is current at the time of printing, but it may not match your machine. Always use the wiring diagram inside the motor junction box.

**WARNING!**

SHOCK HAZARD! Disconnect power before working on wiring.

The machine wiring shown here is current at the time of printing, but it may not match your machine. Always use the wiring diagram inside the motor junction box.

---

**WARNING**

Safety labels help reduce the risk of serious injury caused by machine hazards. If any label comes off or becomes unreadable, the owner of this machine MUST replace it in the original location before resuming operations. For replacements, contact (800) 523-4777 or www.grizzly.com.

---

**Note:** Roller stand shown comes with Model G0870 only.
Grizzly Industrial, Inc. warrants every product it sells for a period of 1 year to the original purchaser from the date of purchase. This warranty does not apply to defects due directly or indirectly to misuse, abuse, negligence, accidents, repairs or alterations or lack of maintenance. This is Grizzly's sole written warranty and any and all warranties that may be implied by law, including any merchantability or fitness, for any particular purpose, are hereby limited to the duration of this written warranty. We do not warrant or represent that the merchandise complies with the provisions of any law or acts unless the manufacturer so warrants. In no event shall Grizzly's liability under this warranty exceed the purchase price paid for the product and any legal actions brought against Grizzly shall be tried in the State of Washington, County of Whatcom.

We shall in no event be liable for death, injuries to persons or property or for incidental, contingent, special, or consequential damages arising from the use of our products.

The manufacturers reserve the right to change specifications at any time because they constantly strive to achieve better quality equipment. We make every effort to ensure that our products meet high quality and durability standards and we hope you never need to use this warranty.

In the event you need to use this warranty, contact us by mail or phone and give us all the details. We will then issue you a “Return Number,” which must be clearly posted on the outside as well as the inside of the carton. We will not accept any item back without this number. Proof of purchase must accompany the merchandise.

Please feel free to write or call us if you have any questions about the machine or the manual.

Thank you again for your business and continued support. We hope to serve you again soon.

To take advantage of this warranty, you must register it at https://www.grizzly.com/secureforms/warranty-card, or you can scan the QR code below to be automatically directed to our warranty registration page. Enter all applicable information for the product.
